
UNIT 10 EMERGENCE OF DIGITAL MEDIA

Structure

- 10.0 Introduction
- 10.1 Learning Outcomes
- 10.2 Defining Digital Media
 - 10.2.1 Understanding Digital, Online, New Media, WWW
- 10.3 Characteristics of Digital Media
 - 10.3.1 Interactivity
 - 10.3.2 Convergence
 - 10.3.3 Immediacy
 - 10.3.4 Archiving
 - 10.3.5 Linkages
- 10.4 Digital Media in India
 - 10.4.1 Digital landscape
 - 10.4.2 Digital Media: Historical Perspective
 - 10.4.3 The Impact of Digital Media on Traditional Media
- 10.5 Digital Media and Journalism: Emerging Trends
 - 10.5.1 Data Driven Journalism
 - 10.5.2 Digital stories
 - 10.5.3 Mapping in Journalism
- 10.6 Challenges
 - 10.6.1 Fake Information
 - 10.6.2 Online Abuse and Threats; Trolling
- 10.7 Let Us Sum Up
- 10.8 Further Readings
- 10.9 Check Your Progress: Possible Answers

10.0 INTRODUCTION

From reading newspaper to watching television; from listening to radio and watching films, each and every media consumption experience has been affected by the emergence of Digital media. Newspapers are being read on laptop, tablets and smartphones. Even while reading the print version there is always a temptation to go online to watch a video using a certain app. Online medium world over is giving a tough competition to Print and TV. A lot of people are consuming media messages not from the established television channel but by subscribing to youtubers. Radio sets are often seen in households unused as people are tuned into their favourite channels through smartphones. The medium has not only affected the consumption pattern but has also affected the way media messages are produced. New technologies have impacted each and every function in a media house. Old ways of working on certain product has been replaced by a new ways of packaging of information which is influenced by the emergence of new

In this unit, we shall discuss the emergence of digital media, digital media landscape, opportunities and challenges that comes with digital media and its impact on the traditional media. There are different terms which are being used interchangeably for Digital Media like online media, new media, ICT etc. All these terms will be discussed for your conceptual understanding.

10.1 LEARNING OUTCOMES

After going through this unit, you will be able to:

- describe what digital media is and how it has impacted the media landscape;
- articulate the effect of digital media on legacy media and how legacy media has adapted to the recent technological advancements;
- analyse the challenges posed by the digital media; and
- explore and use the digital tools for constructing media messages.

10.2 DEFINING DIGITAL MEDIA

Every Industry is relooking and reinventing various processes like production, resource management, marketing and is aligning it to the rules of the digital world. Media Industry too has undergone a sea change through the digital transformation process. Each and every function of a media organisation is affected by the new technologies in recent years. While some media houses were very prompt and active in embracing these changes, others lagged behind. Laggards though could not resist the change for long and had to hop to the digital bandwagon to survive in the industry. Slowly they too embraced technology's meaningful role in the digital world.

10.2.1 Understanding Digital, Online, New Media

In the context of Media, there are numbers of terms which are used interchangeably like New Media, Information and Communication technologies, Digital Media, Online media, Multimedia, Convergence media etc. There are some overlaps, but the meaning varies with the context. Let us explore the meaning of these terms:

- **Information and Communication Technologies:** According to the World Bank ICT consists of hardware, software, networks, and media for collection, storage, processing, transmission, and presentation of information (voice, data, text, images)
- **Digital Media:** The digital process breaks down all information (data, text, graphics, audio, pictures or video) into a sequence of numbers (digits), transports it by wire, cable or broadcast frequency to a destination and then re-assembles it back into its original form. Digital media refers to audio, video, and photo content that has been encoded (digitally compressed). Encoding content involves converting audio and video input into a digital media file such as a Windows Media file. After digital media is encoded, it can be easily manipulated, distributed, and rendered (played) by computers, and is easily transmitted over computer networks. Examples of digital media types include: Windows Media Audio (WMA), Windows Media Video

(WMV), MP3, JPEG, and AVI.

- **New Media:** New Media refers to those digital Media that are interactive, incorporate two-way communication and involve some form of computing as opposed to 'old media' such as telephone, radio and TV according to Robert Logan (2010).
- **Online Media:** This is generic term often used loosely to describe digital information access, retrieval or dissemination. This means accessing information on Internet via modem or telephone line.
- **Multimedia:** Means use of more than one media technique (text, audio, still images, moving images) to tell a story. A multimedia news story then is any piece that uses two or more media to tell it.

The above mentioned terms are deeply linked and thus are difficult to distinguish. The significance of limiting this definition is largely contextual. While the Information and Communication Technology encompasses everything from hardware to software and also include dissemination of information, the focus is on what makes any information digital in the Digital Media definition. In New Media, stress is on how the digital media is being used with interaction and two way communication as its important feature. Multimedia, however is the combination of two or more media techniques which is easily possible only when the information is available in digital format. While there is an overlapping basis for these, however each of these terms have some distinct feature. For this chapter, the term Digital Media will be used to include online platforms, social media, new digital tools, and the new ways of packaging and disseminating information, all in context of media industry.

10.3 CHARACTERISTICS OF DIGITAL MEDIA

There has been a massive growth in the popularity of digital media world over in the last decade. Infact, digital media is seen as a threat to the legacy media. Where ever there is a decline in newspapers' readership, Digital has been quoted as one of the major reason. Whether digital is responsible for the decline in the growth of legacy media will be explored in the sub sections later in this unit. In this section the focus will be on the characteristics that made digital media a popular platform.

10.3.1 Interactivity

The most important characteristic that distinguishes Digital Media from traditional media is 'interactivity'. It allows people to rate, share, like and comment on any message. There is a shift from the limited interactivity which traditional media offered earlier in the form of letters to the editor or the feedback programmes on TV and radio to the unlimited interactivity that digital media offers. This interactivity not only allows people to respond or react to the messages constructed by the media houses but it also turns consumer into a producer, wherein people are not just consuming media messages but they are also constructing media messages. This feature has turned passive consumers into active producers. Most of the news portals now a days are offering opportunities to the users to interact with the content (in case of interactive stories), interact with the producers of the content and are also providing space for the user generated content.

Report for CNN is an example of how mainstream media encourages its audience

to interact with the platform. Here, the interaction is not just by writing comments or rating stories done by CNN but iReport for CNN” is an interactive, international monthly half-hour TV program showcasing the most newsworthy and informative iReport contributions and citizen journalism reports on the internet. Besides sending it to the platform, citizens can post it on Facebook, Instagram or Twitter with the hashtag #CNNiReport. Check the following website to know more:

<http://edition.cnn.com/CNN/Programs/ireport/>

Activity 1

There are many examples of citizen journalism. Try to find out case studies where mainstream media welcomed contributions from citizen journalists.

1.
.....
2.
.....
3.
.....
4.
.....

10.3.2 Convergence

Digital Media makes the merging of various mass communication formats like print, television and radio. On the internet, every medium resides next to another. You can listen to an audio interview, watch the event happening and read the story at the same time. Journalists are using one medium to tell one aspect of the story and another medium to tell another aspect. For example a story on a satellite launch in India might use an explainer video to explain demonetisation, photographs to tell how it is being implemented, text to analyse the initiative and audio for interviews with the experts. All these elements could be combined to tell a story on launching a satellite. This is also called *multimedia journalism*. In this case each media element is an important part of the story. Multimedia reporting is usually confused with parallel reporting. In *parallel reporting* two or three journalists cover a story for print, video or audio. In such cases these stories are independent of each other. As they are separate stories told by different journalists. Even if it is uploaded on the website, the only thing they have in common is subject otherwise stories are different. In multimedia journalism various media elements are weaved in the story according to the requirement of the story. There are number of digital tools which can help journalists to write multimedia stories. Some examples of multimedia story can be seen at the following link:

<https://infogr.am/examples>

10.3.3 Immediacy

Another important characteristic of Digital Media is immediacy. While in radio and television only one thing can be shown at one time and to show another the previous one has to be interrupted, on websites one can have multiple stories and same can be updated as the developments on those events take place. A single

story can post a number of updates on one story. Social networking sites by introducing live broadcasts have changed the game altogether. Traditional Media houses as well as locals can broadcast any event live. The broadcast feature though offers lot of opportunities with just a Smartphone in hand and no other infrastructure. But at the same time use of this feature has drawn lot of criticism.

Here is an example of Live Streaming of Iraqi and Kurdish forces advancing on Mosul. *“So what are we to make of Mosul, as Kurds and Iraqis advance on the city via 24/7 streaming on Facebook Live from Al-Jazeera, Channel 4 News and a Kurdish agency? Do we want an emoji on every blast of destruction? “Like”, “like”, “like” the carnage ... Is this some sort of macabre computer game?”* Peter Preston Columnist with Guardian about Channel 4 News’ Facebook

Live broadcasts is a new trend and to add to this is the latest feature of 360 video by the Live broadcast app like periscope. So it is not just a live shot but with 360 video on Periscope, one can experience moments with the broadcaster and take a look around — it’s one step closer to actually being there.

Activity – 2

Explore Facebook Live or periscope to broadcast local event in your area.

10.3.4 Archiving

Another characteristic that differentiates digital from the legacy media is its inherent capacity to archive news stories, videos, audio and info graphics. The shelf life of news, which used to be very limited, has increased tremendously with all sort of content lying in different shelves of the website. One can visit that content anytime. The tags and keywords act as keys to those shelves. For example an article on global trade can be accessed by typing a search query in the search box. If the article is given a tag like trade, Indian economy etc, it will be easy to retrieve that article from the repository full of millions of articles. So it is important to have well archived website but the same it should be well searchable. The archiving can also help writers to provide important context to what they are presently writing and can be an excellent resources for research. For readers it provides opportunity for non linear consumption of content. They can create their own stories by reading different pieces written by different writers and at different time.

10.3.5 Linkages

Archiving and information available on the web makes linkages possible. It is easy to link the article to something which has been written earlier on the same topic or with an article on same subject written by a different writer. Linkages provide depth to the story. In Digital, for any story the amount of space is limited, so is the case in print, TV and radio where there is limited space and time. While in legacy media the challenge is to tell the entire story in the limited time and space allocated to it but the digital media overcomes this challenge by providing links to other material which is relevant to the story. It could be article in the same website or it could be some report lying outside the website. While linkages broaden the scope of the story and multiple angles can be explored at a time, it also poses a challenge of losing a reader to some other website or content. It becomes very difficult to bring readers back to the site once they are navigated

out of the website to look for some other content. Therefore, it is important to use linkages strategically in any story.

10.4 DIGITAL MEDIA IN INDIA

10.4.1 Digital Landscape

India is going through a digital revolution. The amount of growth which India has seen in terms of internet penetration is unprecedented. India has become second largest country in the world in terms of internet users with 462 million people connected with internet after China. The penetration is 34.8 % according to the <http://www.internetlivestats.com> (**Internet Live Stats** is part of the *Real Time Statistics Project which provides live internet data*). The government's Digital India Programme (Digital India programme has been launched by the Department of Electronics and Information Technology, Ministry of Communications and Information Technology, Government of India) has given fillip to digital media in India. The Digital India campaign is centered around three visions:

- digital infrastructure as a core utility for every citizen
- governance and services on demand
- digital empowerment of citizens

All the digital initiatives to fulfill the abovementioned visions will contribute significantly in strengthening digital media in India. While it has already contributed in increasing the number of internet users in India, the implementation of Digital infrastructure as a core utility to every citizen will also increase the internet penetration which is low as compared to other countries. India has also seen tremendous growth in mobile use both for data as well as voice. Though it took

two decades to reach a billion connections covering over 500 million unique subscribers, India has become one of the largest mobile markets in the world. This trend encouraged people in the media industry to take Media Mobile Apps seriously. Number of media houses have created their own apps so that they can connect with those 500 million subscribers. Also because of the popularity of the platforms like whatsapp and facebook there is a need to repurpose content for those who are consuming media messages using these platforms.

Media industry researches have shown that media content creation, access and consumption have gone through enormous changes in the second decade of the 21st century, globally as well as in India, and shifts would be more dramatic over the next five years by the end of 2020. Three main factors responsible for this trend are:

1. Technology and internet access especially fast mobile data and broadband
2. Gadgets, especially smartphones and streaming media devices
3. The app eco system

The growth in digital advertising has been the maximum over the last few years as compared to other media segments. The reason for this massive growth is the increase in internet user base which includes mobile internet users.

10.4.2 Digital Media: Historical Perspective

Digital Media and Print Media

In India, The Hindu was the first newspaper to start its own website in 1995. Most of the newspapers, thereafter, build their own websites to connect with the people who had access to the internet. In 2007, *Malayala Manorama* became the first regional newspaper to establish its presence in digital media by launching a mobile app. Newspapers like The Times of India, The Hindustan Times, The Hindu and The Indian Express joined twitter in 2009-2010. In 2012, TOI forayed into augmented reality by launching its Alive App. The app allows user to scan any picture or graphic and then take them to the relevant multimedia content. In 2013 mobile media apps became very popular. One app that emerged as a leader was 'Inshorts'. The app was instant success and was based on premise that people would like to consume messages quickly. Hence, the news is constructed in such a way that it delivers the entire story in a few words.

To make their content easily accessible through search engines, many media outlets forayed into Search Engine Optimisation and Digital marketing. Social media marketing became as important as the content. Media houses trained their staff or hired digital marketing agencies just to be on top of the list of the Search Engine Result page and to get more clicks and traffic.

Lot of experiments were being done in the ways news was told. A number of digital tools were explored that allowed development of stories in different ways. This was the year of *immersive storytelling*. Malayala Manorama online started offering 360 degree videos.

Immersive story telling aims at giving the consumers a feeling of really being there' by making use of 3D gaming, 360 degree videos, virtual and augmented reality technologies. The delivery of news and storytelling is made more hard hitting and entertaining by use of advanced technologies.

Digital Media & TV

With the increase in internet connectivity and availability of cheap smartphones, there was an explosion of online videos. Anyone who had an access to technology and internet enabled phone also had the opportunity to create and disseminate videos. One could also do something which was unheard of until a few years back, one could create one's own channel. Depending on the interest, youtube is full of channels on DIYs, politics, news, entertainment, travel, food etc. The reach of many of these channels is much more than that of a traditional TV channel. The last few years have witnessed massive growth in the number of videos created and uploaded. In addition to internet connectivity and cheap smartphones this was made possible by new digital tools that allow creating and editing videos on the go.

Most of the social networking websites like Facebook, Snapchap, twitter integrated these tools so that anyone could create and disseminate these videos for the forty two percent of the world population that is connected with internet. Some of the emerging trends we are witnessing now a days are immersive story telling (360 degree videos), video selfies etc. The Quint, online news platform, roped in Barkha Dutt, senior journalist, during 2017 state elections (UP) for new media journalism. She used selfie videos, Facebook live extensively to cover UP elections.

Also The New York Times announced its launch on snap chat discover forum in 2017. The idea was to reach 41 % of all 18-34 year old in the US as they are using snap chat. In comparison, an average individual US TV network reaches 6% of the same demographic.

The examples of The Quint and The New York Times shows how new technology is shaping the way media messages are constructed. TV no longer has the monopoly over videos, even online newspapers host videos on their portal.

Digital Media and Radio

Keeping in view the increase in internet penetration and growth of smartphone segments in India traditional, broadcast radio channels have taken their stations online and there are companies that run internet based radio service.

Radio has remained a strong partner of the media and marketing mix.

Radio broadcasters are adapting well to how digital channels are changing the industry, turning mobile phones and the internet into a way to extend their brands, protect their listener share, and reach new audiences. Radio stations these days have also created engaging websites and apps, where audiences can listen to podcasts, stream radio broadcasts and experience visual, video, text or interactive content.

-
4.is an app that delivers news content in limited words.

10.5 EMERGING TRENDS IN DIGITAL MEDIA

10.5.1 Data Driven Journalism

Data Journalism, big data, data analytics are buzzwords now a days. Data is being used by media houses to tell stories. Open data movement has made it easier for communicators and journalists to access and use data. Many countries are releasing their data as open data so that it can be used by the public for various purposes. In India, www.data.gov.in platform hosts data from all the Ministries and departments.

(NDSAP) which was notified by Government of India in March 2012 to promote a culture of data sharing and data utility for meeting larger socio-economic goals. Adhering to the norms laid out by this policy, the National Informatics Centre (NIC) has set up Open Government Data (OGD) Platform India – (<http://data.gov.in>) which is a state of the art dynamic data sharing platform espousing the principle of Open Government Data. The portal has many rich features to support this policy such as:

- ‘Search & Discovery’ mechanism for instant access to various datasets of great importance
- Community engagements around published datasets for innovative applications

on open data with an ability to provide customised citizen services. Tools/Apps/Visualisation so developed by using this platform has played a pivotal role in increasing the level of transparency and citizens' participation in the governance process.

Data Portals.org is the most comprehensive list of open data portals in the world. It is curated by a group of leading open data experts from around the world - including representatives from local, regional and national governments, international organisations such as the World Bank, and numerous NGOs. The data available on these platforms are freely available for the researchers to work on.

According to David Anderton, freelance journalist Data journalism is bridging the gap between statisticians and wordsmiths.

Data journalism is about using sheer scale and range of digital information to tell compelling stories. The focus in Data journalism is not on what happened but on what a particular development means.

There are a number of digital tools which are available to work on data based stories. Some of the tools are as follows:

1. Google fusion table
2. Lucid chart
3. Silk
4. Infogram
5. Picktochart
6. Tableaux
7. Carto

Activity

Explore the following website to see the amount and range of data available : www.data.gov.in

10.5.2 Digital stories

Digital stories is a new way of storytelling. This means telling stories by using computer based tools. They are also known as digital documentaries, computer-based narratives, digital essays, electronic memoirs and interactive storytelling. *They all revolve around the idea of combining the art of telling stories with*

a variety of multimedia, including graphics, audio, video, and Web publishing.

The duration of digital stories are shorter i.e. from 2 to 5 minutes. Some of the tools which are used to tell digital stories are:

1. Powtoon
2. Moovly
3. We video

Activity 3

Following is the link of digital story on Panama leaks. Watch this to understand the concept which is explained with Piggy banks. Find out some more digital stories on web and attempt to make one yourself on a subject of your choice.

The Panama Papers, explained with piggy banks <https://www.youtube.com/watch?v=k2APYPjTWZ8>

10.5.3 Mapping in Journalism

‘Where’ is the important element of 5Ws and one H in journalism. It not only describes the place where the event took place but can tell a great deal about the story. The geography, culture, politics and economics has to do a lot with any event occurring at a particular place. So if it is news about Nepal earthquake, the geographical features of that place become important and if it is news related to Arab spring, the political environment of those countries in the Middle East become important. While few years back the name of the place in the story was enough or one or two shots of the location were adequate. Today, we are at time when Digital savvy readers prefer to have immersive experience. How about feeling the place, exploring more than what one shot offers, navigating from one place to another or visiting different locations to find out more information? It would be interesting and enriching to be a part of the scene and experience the fun, excitement, horror, pain accompanied with the story.

With live broadcasts and geo tagging, there is lot of information being generated from various locations. The information generated from various sites can be an excellent resource for the journalists. Putting this information together and converting into a story can be a challenging task.

Mapping can be a powerful storytelling tool, which journalists can use to take their audience on a journey following a narrative storyline, or to illustrate and make sense of fast moving breaking news events (Catalina Albeanu 2014).

Mapping places and live broadcasts are emerging trends and to add to this is the latest feature of 360 degree video by the Live broadcast app like periscope. So it is not just live shot but with 360 degree video on Periscope, one can experience moments with the broadcaster and take a look around — it’s one step closer to actually being there.

The new technologies have made both generation as well as storage of data possible. There is a lot of data based on locations. According to Gustavo Faleiros,

data journalist and media trainer most data sets contain location-related information that makes them good candidates for mapping. “Maps are also a great tool for allowing user interaction,” said, “and just a great way to tell stories.”

There are hundreds of tools available to create maps. Some are free, some paid and some available on fermium model. The learning curve for these tools are also varied. There are tools that can be learnt easily and there are some with steep learning curve. To get started, Google Maps is the easiest option. One can start by mapping schools, colleges or the places to visit or places visited to begin with. Google My Maps can be accessed by searching in search engine or Go <https://www.google.com/maps/d/>

How to create your own Map

- Step 1 Visit google maps and click on menu
- Step 2 In Menu, click your places
- Step 3 Create maps

Other tools for mapping are:

- 1) Google fusion table
- 2) Story map
- 3) Carto
- 4) Infogram

Activity 4

Create your own map by using Google my Maps.

10.6 CHALLENGES

10.6.1 Fake information

While digital media has made work of communicators easier by providing cheap platforms and easy to use digital tools, it also poses lot of challenges for the producers as well as consumers of media messages. No doubt, Digital Media has democratised the media landscape by providing others an opportunity to create and disseminate. Anyone can be a producer, director, writer and distributor but this also poses lot of challenges. There is a lot of information which is available on the web that is inaccurate. Hence a new term “Post Truth” was coined which means “circumstances in which objective facts are less influential in shaping public opinion than appeals to emotion and personal belief.”

During the US presidential election we have seen barrage of fake news like Pope’s support to Donald Trump and Hillary’s link with ISIS. There were around hundreds of fake websites created in Macedonia to spread such false information. In India too we witness continous flow of such messages on whatsapp, twitter and facebook. Lot of initiatives are being taken to curb this. Facebook has added

“It’s a fake News story” options for the users to report any fake story. Facebook will also flag fake news stories with the help of users and third party fact checkers. Lot of third party fact checking organisations have sprung up in the last few years to curb the flow of false information. The movement is led by organisations like International Fact- Checking Network. As part of this network more than 100 websites conduct fact checks. In India, there are two organisations which are conducting fact checks fact check. in and check4spam.com. Though there is a need for such initiatives, this should be supported by digital literacy campaign.

10.6.2 Online abuse and Threats; Trolling

Internet has made lives easier for those who want to use it for constructive purposes as well as for those who would like to use it in destructive and disruptive ways. This practice of using Internet for destructive ways in a social setting with no apparent instrumental purpose is termed as Internet Trolling. The concept has emerged recently and researches are being done on Internet Trolling as a phenomenon. The purpose and intent of trolls, their psychology and their process of creating chaos online is an important area of study keeping in view the drastic increase in number of such cases world over. A closer look at the trolls and their comments shows a pattern. From a person seeking attention by being disruptive to the one enjoying hurting others displaying sadism to the one taking advantage of being anonymous online, internet trolls can be categorised in number of ways.

Who are *Internet trolls* ?

Internet Trolls are the individuals on web who connect to create chaos. According to researcher, Dr. Claire Hardaker, troll is “a computer user who constructs the identity of sincerely wishing to be part of the group in question ... but whose real intention is to cause disruption and/or trigger conflict for the purposes of one’s own amusement.”

Dr. Claire categorised trolls in the following manners according to their intent and the people or issues they target.

1. RIP trolls, who spend their time causing misery on memorial sites
2. Fame trolls, who focus all their energies on provoking celebrities;
3. Care trolls, who purport to see abuse in every post about children or animals
4. Political trolls who seek to bully MPs out of office; and many others besides.

Helen Lewis (2014) in her article “Who are the trolls” published in New Statesman added two more categories to this:

1. Sub cultural trolls - or “true” trolls - the ones who trawl forums full of earnest people and derail their conversations with silly questions, or hackers
2. Professional trolls” or “trollumnists”: writers and public figures whose media careers are built on their willingness to “say the unsayable”; or rather, say something which will attract huge volumes of attention (albeit negative) and hits.

US Researcher Alice Marwick gives the following explanation for Internet Trolling: "There's the disturbing possibility that people are creating online environments purely to express the type of racist, homophobic, or sexist speech that is no longer acceptable in public society, at work, or even at home." Anonymity hence is the biggest reason for Internet Trolling. This anonymity leads to online disinhibition which is one of the characteristic of Internet Trolling. According to Psychologist John Suller (2004) some people self-disclose or act out more frequently or intensely when they are online. He explored six factors that interact with each other in creating this online disinhibition effect: dissociative anonymity, invisibility, a synchronicity, solipsistic introjection, dissociative imagination, and minimisation of authority. Personality variables also will influence the extent of this disinhibition. All the above factors described by Suller triggers internet Trolling.

10.7 LET US SUM UP

Digital Media in India is growing at a very fast pace. Keeping in view the various initiatives under digital India which will strengthen the digital infrastructure, this trend will continue. The Indian Media Industry has embraced digital and all the platforms including print, magazines, TV and radio are adapting themselves to remain relevant in the digital era. The Digital Media offers a lot of opportunities like new ways of storytelling, marketing and research but at the same time it is being criticised for creating lot of chaos by spreading false information and the issue like trolling has caught the attention of many in the recent years. The medium offers lot of features, it is up to the people on how these features can be exploited constructively. And the visions of Digital India puts it very succinctly that with Digital infrastructure for every citizen and government services on demand, there is also a great need for digital empowerment of citizens if India has to become a digitally empowered society and knowledge economy.

10.9 CHECK YOUR PROGRESS: POSSIBLE ANSWERS

Check Your Progress 1

1. Once digital media is encoded, it can be easily **manipulated, distributed, and rendered** (played) by computers, and is easily transmitted over computer networks
2. **iReport** for CNN is an example of how mainstream media encourages its audience to interact with the platform
3. Interactivity, Immediacy, Linkages, Convergence
4. This means traditional media offered limited interactivity earlier in the form of letters to the editor or the feedback programmes on TV and radio whereas digital media provides opportunity for unlimited interactivity. This interactivity not only allows people to respond or react to the messages constructed by the media houses but it also turns consumer into a producer, wherein people are not just consuming media messages but they are also constructing media messages. This feature has turned passive consumers into active producers.

Check Your Progress 2

1. Digital India Programme has been launched by the Department of Electronics and Information Technology, Ministry of Communications and Information Technology, Government of India)

Evolution of Mass Media

2. Digital Infrastructure as a core utility for every citizen

Governance and services on demand

Digital empowerment of citizens

3. Alive App

4. Inshorts

Check Your Progress 3

1. To promote a culture of data sharing and data utility for larger socio-economic goal
2. DataPortals.org is the most comprehensive list of open data portals in the world.
3. Infogram, Google fusion table, Carto
4. Google Mymaps, Storymaps, Google Fusion table
5. Circumstances in which objective facts are less influential in shaping public opinion than appeals to emotion and personal belief.”
