
UNIT 9 DEVELOPMENT OF TELEVISION

Structure

- 9.0 Introduction
- 9.1 Learning Outcomes
- 9.2 History of Television
 - 9.2.1 International Perspective
 - 9.2.2 National Perspective
- 9.3 Television in India
 - 9.3.1 Television for Development
 - 9.3.2 Site to Asian Games
- 9.4 Television after Gulf War
 - 9.4.1 Star and Zee Television
 - 9.4.2 24x7 News
 - 9.4.3 Regional Television
- 9.5 Looking at the Future
- 9.6 Let Us Sum Up
- 9.7 Further Readings
- 9.8 Check Your Progress: Possible Answers

9.0 INTRODUCTION

In the previous units of this block you have been given extensive information about the origin of Mass Communication. You have also by now understood how the trajectory of print, and radio had shaped in the country. You also have marked an interesting development in print i.e. the growth of the language press. You must have also understood the uniqueness of this growth, which has a mixed legacy of colonial heritage and independence struggle.

In this unit we will discuss with you the growth of the most intriguing of all media, i.e. television. How from a neglected child of the Indian government it turned out to be the blue eyed boy. We will also understand the phenomenon of 24 hours television channel and how it has percolated down to the growth of regional television channel. This journey will also be interesting and you will definitely find answers to many question that you had been asking yourself about television.

9.1 LEARNING OUTCOMES

The broad objective of this unit is to help you again in depth knowledge of the growth and development of television nationally and internationally. At the end of the unit you should be able to:

- describe the historiography of Television;
- explain the philosophy that defined Television in India; and

- analyse the political economy of the growth of TV in India.

9.2 HISTORY OF TELEVISION

9.2.1 International Perspective

The first successful demonstration of television was in San Francisco on Sept. 7, 1927. This system was designed by Philo Taylor Farnsworth, a 21-year-old inventor whereas Boris Rosing in Russia had conducted some crude experiments in transmitting images 16 years before Farnsworth's successful experiment. There were other sporadic experiments too in other parts for example, John Logie Baird in England and Charles Francis Jenkins in the United States in the 1920s. However, Farnsworth's invention, which scanned images with a beam of electrons, can be regarded as the direct ancestor of modern television. The first image he transmitted on it was a simple line. Soon he aimed his primitive camera at a dollar sign to answer an investor's queries, "When are we going to see some dollars in this thing, Farnsworth?"

EARLY DEVELOPMENT

In USA RCA, the company that dominated the radio business in the country invested \$50 million in the development of electronic television. In 1939, RCA televised the opening of the New York World's Fair, which also made President Franklin Delano Roosevelt, the first president to appear on television.

World War II slowed the development of television, as companies like RCA turned their attention to military production. Full-scale commercial television broadcasting in USA began in the United States only in 1947.

In 1947 the House Committee on Un-American Activities began an investigation of the film industry, and Senator Joseph R. McCarthy claimed that there was a visible Communist infiltration in broadcasting too. Political beliefs suddenly became grounds for getting fired. Most of the producers, writers, and actors who were accused of having had left-wing leanings found themselves blacklisted, unable to get work. CBS even instituted a loyalty oath for its employees. Among the few individuals in television well positioned enough and brave enough to take a stand against McCarthyism was the distinguished former radio reporter Edward R. Murrow. In 1954 the U.S. Senate censured McCarthy, and CBS's "security" office was closed down.

Between 1953 and 1955, television programming began to take some steps away from radio formats. The programming that dominated the two major networks in the mid-1950s borrowed heavily from another medium: theater.

In 1964 color broadcasting began on prime-time television. The FCC initially approved a CBS color system, then swung in RCA's favor after Sarnoff swamped the marketplace with black-and-white sets compatible with RCA color (the CBS color system was not compatible with black-and-white sets and would have required the purchase of new sets).

PUBLIC BROADCASTING

A Carnegie Commission report in 1967 recommended the creation of a fourth, non-commercial, public television network built around the educational nonprofit stations already in operation throughout the United States (see television, non-commercial). Congress created the Public Broadcasting System that year. Unlike commercial networks, which are centered in New York and Los Angeles, PBS's key stations, many of which produce programs that are shown throughout the network, are spread across the country. PBS comprises more than 300 stations, more than any commercial network. PBS funds come from three major sources: congressional appropriations, viewer donations, and private corporate underwriters.

INTERNATIONAL GROWTH

Growth of Television in development followed different patterns in other countries. Often government, not private corporations, was the owner. In Great Britain the British Broadcasting Corporation, the country's dominant radio broadcaster, established and retained dominance over television. The BBC, funded by tax on the sale of television sets, established a worldwide reputation for producing quality programming. The Canadian Broadcasting Corporation also functioned independent of government support albeit due to commercial pressures, however maintained the seriousness of much of its news and public-affairs programming. France's major television networks enjoyed government patronage; however, there was protest in France that it led to the tilt in news coverage toward the ruling party. By the late 1980s and 1990s, as cable and direct-satellite television systems increased the number of channels, the hold of these government-funded networks began to weaken. Most countries around the world began moving more toward the U.S. model of privately owned, advertiser-supported television networks.

9.2.2 National Perspective

Now that you have been apprised of the international scenario of the growth and development of Television, let us come to the national perspective. India resisted television for a long time. But it got a boost during the 1980s. From the 90s Indian Television history spanned out in an entirely different way. As per the Information and Broadcasting Ministry website till 6th March 2012 the number of television channels beaming into and out of India are 831.

We will now discuss the multifarious nature of growth of this challenging media.

9.3 TELEVISION IN INDIA

As mentioned in Unit 8, the National Planning Committee convened by the Indian National Congress set up a sub-committee on Communication to offer recommendations for development of communication for independent India. After independence of the country in 1947, the new Indian government adopted Development Communications as the mainstay of communication policies. But it is interesting to note that Nehru resisted Television. In fact many call it ironical as Nehru was quite well read, aware of developments elsewhere and admired the Soviet Union, where the use of newspapers and films for state goals had received great attention and patronage from the government.

Before Chanda Committee, no review of the broadcasting policies was done in

India. The committee was formed in 1964 under the chairmanship of Asok K. Chanda, and was called the Committee on Broadcasting and Information Media. The Committee report strongly reflected the development imperatives that governed the philosophy of broadcasting in the sixties and the seventies. It blamed insufficient allocation of resources for the development of the mass media for the “inadequate information, poor motivation and insufficient participation by the masses in the country’s development programme”. It may be mentioned here that the committee was mainly looking at the status of radio, as television was still confined to Delhi; however the report of the committee did look futuristically at the growth of television too.

Though Nehru was hesitant about introducing television in India, but scientists like Vikram Sarabhai argued that television should be given special priority for accelerating national development. He believed in the power of technology in taking forward the national agenda for implementing schemes of economic and social development. This was of particular significance for population living in isolated rural countries.

1. Who is generally credited as the father of television and why?

.....

.....

.....

.....

2. When did the world’s first colour broad cast happen? Write briefly.

.....

.....

.....

.....

3. Which country began the first television service? Write in detail.

.....

.....

.....

.....

4. Do you think Nehru’s views on TV have been proved right? Explain briefly.

.....

.....

.....

In September 1959, the experimental television services of All India Radio began as part of a UNESCO pilot project. The transmitter for the broadcast had been sold at a nominal cost by Philips India Ltd., a multinational electronics company which had exhibited closed-circuit television technology at an industrial fair in Delhi in 1955. UNESCO donated 45 television sets to teleclubs in secondary schools too. In early 1961, UNESCO funded another experiment in the effectiveness of social education. In 1961 Ford Foundation too joined the bandwagon and sponsored school programmes for four years. This project also included exchange training for programme personnel between US and India. In fact in 1961 this experimental service had become a regular service but remained confined to Delhi.

Sarabhai motivated Indira Gandhi to support an indigenous satellite development programme after she became the prime minister in 1966. He proposed India's first experiment with farm television in 1967 and was the first to champion the idea of using direct broadcast television to reach the most difficult and least developed areas of the country first, rather than the urban population.

The second station was commissioned after a gap of thirteen years in 1972 in Bombay (now Mumbai). However it is interesting that after Bombay the next two stations were established in Amritsar and Srinagar in 1973. By then India had already fought two wars with Pakistan and the people in Amritsar had access to Pakistan TV beaming across the border. So when these two transmitters were set up those also could beam onto parts of Pakistan. The Government also sent around 250 television receivers into villages in the Kashmir Valley. The Transmission hours of the Srinagar station was increased phenomenally to counter the propaganda by Pakistan Television which was received very clearly in the valley, and naturally attracted much attention. After that, in 1975 the next phase of commissioning of stations spread television to Calcutta, Madras and Lucknow.

9.3.2 SITE to ASIAN Games

The Satellite Instructional Television Experiment (SITE) was an experiment which was also a brainchild of Vikram Sarabhai. However Sarabhai died in 1971 before the project could take off. But he had already groomed a group of young energetic scientists who saw to it that the experiment was a success. According to Bela Mody, "SITE was conceived in the mid 1960s when mass media was considered powerful agents of development and satellites were becoming available to carry the development message to otherwise unreachable areas".

SITE was provided a telecommunications satellite on loan by NASA to broadcast for one year during 1975-76. This project was developed in close cooperation with the United Nations, which helped to set up the Experimental Satellite Communication Earth Station in Ahmedabad. In return, India provided training facilities for representatives from developing countries. It started beaming development oriented programmes to 2400 Indian Villages, and the software was designed according to the socio cultural specificities of the targeted population.

SITE was also important because of it getting support from some important personalities. Most prominent of them was the influential ISRO scientist, Vikram Sarabhai. He was very vocal about the necessity of using television to 'leap-frog' India into sustained economic growth and development. Sarabhai was also instrumental in setting up ISRO (Indian Space Research Organisation) and the setting up of SITE was obviously helping ISRO to take off too. Another important

individual who contributed to the success of SITE was the Director of Space Applications Centre in Allahabad, Professor Yashpal. He was instrumental in getting ISRO the rights to producing programmes for SITE whereas the administrative rights was still with All India Radio (AIR). He further argued for the continuation of ISRO's involvement in educational programming after the SITE experiment ended. Even the extensive evaluation of the programmes was done under the aegis of the Development and Educational Communication Unit (DECU) of ISRO.

The third and the most important person in this whole activity was none other than Indira Gandhi, the then Prime Minister of India, who was in fact going through a very rough patch at that time in her political career. As author and social scientist, Bela Mody commented, "The most decisive reason was the demonstration of the political advantages of the government controlled communication system that reached villagers in the remotest corners of the country with the official line from the party in power. The daily satellite news programme gave the then beleaguered prime minister...instantaneous monopoly access to voters."

It was also a safe mode of introducing the new medium which took 23 years to reach India and even after that it remained mostly confined to the metros or other such urban spaces. Because those who had an interest in the expansion of the industry also realised that educational experiments would be the least risky introduction to the new industry.

It has been pointed out by critics that the beneficiaries of SITE included indigenous manufacturers of satellite equipment, their foreign counterparts that included NASA, Ford Aerospace, General Electric, Hughes Aircraft, Massachusetts Institute of Technology and not to forget 'the members of the international community who were interested to have a general case study of educational broadcasting by satellite.

There was one offshoot of the SITE project, the KHEDA project conducted in the Kheda district of Gujarat, which was experimenting in participatory programme making in a small village on their local and often 'controversial' issues. It started in 1975 and even won the UNESCO prize in rural communication in 1984. But in 1985 the transmitter was dismantled and sent to Chennai for starting an entertainment channel. According to P.C. Joshi, "The Kheda Project...was wound up under tremendous pressure of the new rural middle class which was carried away by the glitter and glamour of the new television software..."

During the internal emergency of 1975-77 a strict regulation was imposed on the functioning of all forms of media; the state controlled media, being the first and most serious victim. As soon as the Janata Party Government came to power, they had constituted a commission chaired by a retired Chief Justice of the Supreme Court J.C. Shah, to investigate the excesses committed during the Emergency and the government brought out a white paper on the issue. It was submitted in August 1977 and immediately a working group headed by the former newspaper editor B. G. Verghese was constituted to look into the issue of autonomy of Doordarshan (DD) and All India Radio (AIR) both state controlled media apparatus.

The Committee proposed the formation of a trust which it called Akash Bharati. The bill was introduced in the Parliament immediately but lapsed after the dissolution of the Lok Sabha in 1979 when the Janata party led Government fell. Mrs. Gandhi returned to power in 1980 and her government decided not to back this

Bill because, according to the report for 1979 to 1980 of the Ministry of Information and Broadcasting (MI&B), “such an organization is not considered necessary to enable those mass media to discharge their basic objective of serving people who are not served by other media” (MIB Report 1979-80).

In July 1980 the MI&B issued policy guidelines for the official media and placed before both houses of Parliament. In November, the Government constituted an advisory committee headed by G. Parthasarathi and it submitted a document called *News Policy for Broadcast Media*, which was issued by the government in May 1982. Interestingly these guidelines instruct the news gathering apparatus to “make a deliberate effort to explore new areas of development and nation-building news” (MI&B report 1982). And it stresses that “in a developing country the special function of broadcasting should be the coverage of development, its significance, achievements and problems.”

Again in December 1982 the Government appointed a Working Group (WG) on Software for DD with the objective of preparing “a software plan for DD taking into consideration the main objectives of television of assisting in the process of social and economic development in the country and to act as an effective medium for providing information, education and entertainment.” (WG report)

During the days of Indira Gandhi, the infrastructure for television communication received a major boost. The major trigger was the phenomenal popular transmission of the 1982 Asiad Games which was hosted by India. S.S. Gill, an officer of the Indian Administrative Service who was involved in creation of stadia, roads and other infrastructure for the Asian Games, was appointed Secretary of Ministry of Information and Broadcasting with the express purpose of creating an all India structure of television network within a short span of time. Beginning July 1983, an 18-month project to expand the network was sanctioned by the government, with a budget allocation of Rs 680 million.

However it was not designed to increase the diversity of programming available, but rather to increase the reach of programming that originated in Delhi. All the stations in the entire country were required to uplink programme broadcast by Delhi centre from 8.30 to 11pm. As most of the programmes were in Hindi, it created problems as it was seen as an imposition on the other regions by New Delhi.

After the assassination of Mrs. Gandhi (31st of October 1984), Rajiv Gandhi became the Prime Minister of India riding on the sympathy vote, while Doordarshan lured the voters with the constant visuals of the mourning masses. At that time the state controlled media had the traditional regulation of mourning for seven days in continuation in case of demise of the head of the state, which was subsequently changed in the late 1990s.

After Rajiv Gandhi became the Prime Minister, he called for greater independence for Doordarshan. Between the years 1984-85 over 120 television transmitters were installed in India. Bhaskar Ghose along with the support of Minister of Information and Broadcasting V.N. Gadgil went for total upheaval of the programming pattern. However Gadgil had succumbed to the political pressure when he was asked to resign in 1986 during a cabinet reshuffling. In 1987, Bofors arm scandal rocked the nation and Rajiv Gandhi had to face the heat. In fact his entire duration was full of troubles, the Bhopal Gas Tragedy happened only two months after he became the Prime Minister, his Sri Lanka policy was highly criticised. However by April 1988, Doordarshan had already begun to air

documentaries on sensitive issues like Bofors arms kickback controversy, Gorkhaland agitation, Sati (sparked by the death of Roop Kanwar in September 1987) etc. In October Ghose was transferred out from Doordarshan.

The ruling party decided to go for a damage control drive with the help of Doordarshan. In April 1989, Mr. K. K. Tewary was appointed Minister of State for Information and Broadcasting. After this, use of media as an election strategy became blatantly heavy handed. But not all the states followed the dictates, mainly those ruled by the non Congress government. The left front government banned the entry of the Doordarshan camera men into the government functions. The print media too led by *The Indian Express* led a campaign against such brazen use of Doordarshan.

All these did not really translate into win for the ruling party. The Congress got 137 seats and emerged as the single largest party but did not form the government. The V.P. Singh led a coalition government which was short lived and conflict driven from the very beginning. However Doordarshan was asked to be more objective and stop broadcasting news of the ruling party leaders alone. The first move of the government was to propose the Prasar Bharati Bill aiming at granting autonomy to the electronic media in 1989. It sparked nationwide debate and deliberation. However despite the repeated assurances by V.P. Singh and Minister of Information and Broadcasting P. Upendra, by July 1990 it became clear that the bill will not be enacted.

Slowly the initial euphoria of change died down and Doordarshan went back to its role as propagandist. P. Upendra's interview to the press in fact summarised the mood:

I admit that Doordarshan is not autonomous today...Frankly, they're not ready for autonomy- they are conditioned to being dictated to at every stage, they're not used to using their own judgement. They don't know how far they can go. They're confused and it shows (Times of India, 1990: 3)

This in fact echoed the sentiment of Rajiv Gandhi when he was asked in The Press Club of America in 1985 about his plans of giving autonomy to the Ministry of Information and Broadcasting. He answered: "At the moment none...We feel India is not ready for it yet".

9.4 TELEVISION AFTER GULF WAR

The glorious monopoly of Doordarshan came to an end when Star TV based in Hong Kong started beaming programmes into India via ASIASEAT-1 satellite in May 1991. In fact satellite television came to India as an agent of global capitalism. Cable Television made a stealth inroad into the Indian homes of the middle class who are the natural and major consumer of television. This development coincided with the Indian government accelerating its process of economic liberalisation. As if in keeping with the new thinking, the government did not try to restrict or ban the reception of foreign channels. Some critics were of the view that the initial response of the government to the illegal transmission and distribution of cross-border television channels was one of tolerance rather than of resistance. The Congress party, which had ushered in a new economic policy of liberalisation, did not wish to give the impression that it wanted in any way to restrict or block the transnational television channels.

It has been observed by some that cable television in India grew in the absence of a cohesive communication policy and can be called a sheer entrepreneurial genius. It is an exemplar of entrepreneurial initiative leading and outrunning government policy. Almost as a knee jerk reaction, the Government constituted a committee for an assessment of the consequences of introducing competition in the electronic media.

Simultaneously the Ministry was also deliberating on opening up the airwaves to the private players and so in September 1992 another committee was constituted to look into the matter. The committee was specifically asked to work out the modus operandi to give licences to private producers to produce programmes for the second channel of Doordarshan as well as on FM radio channels. This was a drastic policy change as the Government was warming up to the idea of inculcating private players to their fold with not much censor. The airwaves were opened up and then came the deluge in India's broadcasting reforms. In 1995 the move to promulgate an ordinance regulating cable television was made, and the following year a cable law with certain provisions of regulating the content broadcast were introduced and passed. It was enforced throughout the country but never implemented.

9.4.1 Star and Zee Television

Hong Kong based STAR (Satellite Television Asian Region) entered into an agreement with an Indian company and Zee TV was born. It became the first privately owned Hindi satellite channel of India. The agreement between STAR and Zee did not last long. But the Indian television audience was waiting for a shift from the monopoly of Doordarshan and soon a number of private channels emerged.

The private channel business was not popular amongst the Indian business men immediately. It was only Subhash Chandra who started Hindi Zee TV and Sashi

Kumar who started the first indigenous channel in Malayalam, Asianet. Subhash Chandra raised huge resources from a British Businessman Sir James Goldsmith and also from Indians living abroad and signed a deal with Star on 25th April 1992 and the new channel, Zee TV which started broadcasting from October the same year.

Similarly Asianet also ran into rough weather as far as finance is concerned. India still had legal and technical restraints on private broadcasting. Therefore Asianet had to set up its base in Russia. However the Kerala government helped Sashi Kumar in using the Kerala State Electricity Board poles to be used by Asianet for ten years. Slowly the fortune for Asianet too began to change.

Media mogul Rupert Murdoch bought 64% stakes in the Hutch Vision Limited, the supplier of programmes to star TV for \$525 million in July 1993. Subhas Chandra rejected Murdoch's overtures and resulted in a long battle and went on till 1999 when he bought back all the stakes of Murdoch in Zee for \$300 million.

Star TV became popular primarily due to two reasons: the Gulf War live coverage of CNN and because it became possible to directly download the signals as satellites dishes grew in numbers. The reaction of the India government was to immediately launch satellite channels of its own under the umbrella of Doordarshan. The government also tried to offer its satellite platforms to global companies like CNN, which of course was short lived when CNN found a transponder of its own.

In 1995 itself Sengupta Committee was constituted to look into the almost forgotten Prasar Bharati Bill of 1990 and it rang the bell on allowing privatisation of both radio and television. STAR TV again became the force behind jostling the government from its slumber, when they declared their plan to launch DTH (Direct-to-home) services in India. This led to the meeting of the Committee of Secretaries of various Departments under the aegis of the Cabinet Secretary in January 1997.

In July 1997, the Ministry of Communications issued a notification prohibiting the use of broadcast apparatus for the transmitting or receiving of signals in frequency bands above 4800 MHz. And the explanation given was that DTH "would enable any broadcaster within or outside India to telecast or beam any programme of his choice directly to the houses and bedrooms of the general public" (Ministry of Communication Notification, 1997, Reprinted in Gazette of India Extraordinary, July 16, 1997, at 4.) Murdoch's STAR TV went to the court, invoking the freedom of speech in Article 19 (1) of the Indian Constitution.

The change of guard in the United Front Government and a new Minister in MI&B resulted in the notification of the Prasar Bharati Bill in July 1997. Though the issue of autonomy was already diluted even before the notification, but the sheer exercise of notifying the bill did amount to a statement of purpose. A number of changes were later incorporated like the scrapping of the parliamentary committee, transferring the asset of AIR and DD on lease, reduction of number of government officials to one etc. On September 15, 1997, the notification came into force, finally bringing Prasar Bharati into existence. Parliament met in November 1997, but the Lok Sabha ended up getting dissolved. Before the Fresh elections were declared the bill was ratified so that the board can continue till the formation of the new government. However even that move had not been able to ensure autonomy to AIR and DD. In fact in 2011, all the Prasar Bharati employees have been again designated as government employees and CEO was caught in a case of corruption.

The Telecom Regulatory Authority of India (TRAI) issued a Consultation Paper (No. 13/2008) on Media Ownership on 23rd September 2008, wherein it was stated, ‘.... the issues of cross media restrictions are to be addressed in an inclusive manner covering broadcasting services, print media and other miscellaneous ownership within the fold of telecom, information and broadcasting’ (pg.2). The consultation paper refers to three types of restrictions—cross media ownership across electronic and print media, vertical integration within particular media segments and market-share based restrictions. But reality is far removed.

9.4.2 24X7 News

India got her first private 24-hour news channel in 1998 and by 2007 it grew to 300 television channels of all genre combined. The precursor of ‘live news’ was news programme called *News Tonight*, privately produced by NDTV owned by Prannoy Roy and Radhika Roy broadcast through Doordarshan every night. The then Director General of Doordarshan, Rathikant Basu was the one who brought the new idea.

When Rathikant Basu was hired as Star’s head of operations, it opened the doors for NDTV. It got a prime-time slot for half-an-hour news bulletin on two Star channels— Star Plus and Star—World. In 1998 the historical decision of Star and NDTV to start India’s first 24-hour news channel called the Star News coincided with the 1998 general elections. When NDTV’s five year contract ended with Star in 2003, it went to set up its own channel NDTV 24X7. That was the beginning of the 24X7 news channels.

9.4.3 Regional Television

Yet another important development in the last few years is the impressive growth of Regional language Television Channels which cater to the regional eye balls as well as those people from the region who are scattered around the country and many-a-times even to the diaspora.

The growth of these regional news channels of 24x7 format with either political leaders or business conglomerates owning most of them, is now the trend in the contemporary history of Indian television. Cross media ownership and foreign direct investment has changed the entire political economy of television sector.

9.5 LOOKING AT THE FUTURE

The growth of the news channels of 24x7 format with either political leader or business conglomerates owning most of them, is now the trend in the contemporary history of Indian television. Cross media ownership and foreign direct investment has changed the entire political economy of television sector. The future is full of anticipation and apprehension as we need to remember that this entire growth story has been chartered in the background of media policy vacuum. The latest debates had been on paid news and regulation, and it will be interesting to observe which way it pans out.

9.6 LET US SUM UP

We hope by now you have an idea about the growth trajectory of television in India as well as that of the International scenario. From a reluctant governmental approach to a sudden spurt in 1990s, television has now become the dominant medium in India. However the Public Service broadcaster has not fared so well in this hullabaloo. It is still under the governmental control but with a very impressive all India presence. While the private channels are here to stay, a serious revamping of Doordarshan needs to be undertaken. A country which is lagging behind in so many social parameters needs a responsible Public Service broadcaster doubt.
